# Capstone project

PERIN LEA

#### Sommaire

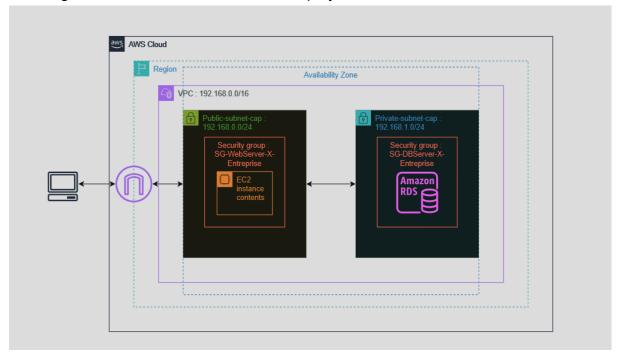

- 1. Introduction
- 2. Architectural Diagram
- 3. Design Rationale
  - 3.1 Virtual Private Cloud (VPC)
  - 3.2 Subnets and Routing
  - 3.3 Internet Gateway
  - 3.4 EC2 Instances
  - 3.5 AWS RDS (Relational Database Service)
- 4. Deploying Cloud Architecture
  - 4.1 Creating Virtual Private Cloud (VPC)
  - **4.2 Adding Internet Gateway**
  - 4.3 Creating EC2 Instances
  - 4.4 Configuring PostgreSQL Database on RDS
- 5. Database Management
  - **5.1 Database Creation**
  - 5.2 Postbird Usage
  - **5.3 Database Connection**
- 6. Conclusion

#### 1. Introduction

This document outlines the architectural design and deployment strategy for hosting the X Company's website on the AWS cloud infrastructure.

### 2. Architectural Diagram

The diagram below illustrates the cloud deployment architecture :

### 3. Deploying Cloud Architecture

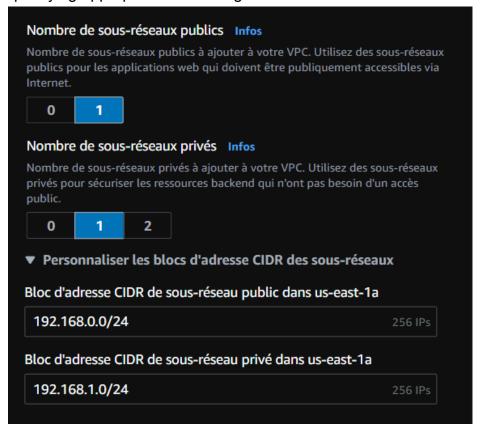

## 3.1 Creating Virtual Private Cloud (VPC)

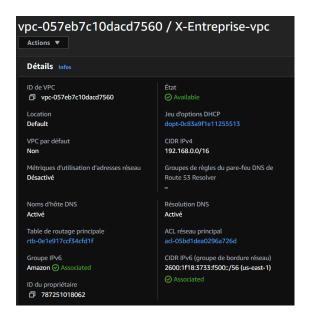

- → Log in to the AWS console.
- → Go to the VPC service and click on "Create VPC".

→ Specify VPC details such as name, CIDR block

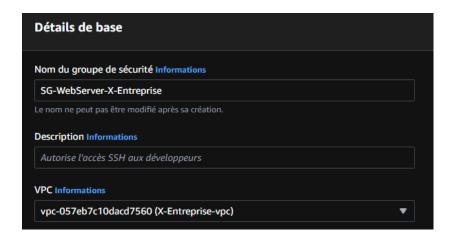

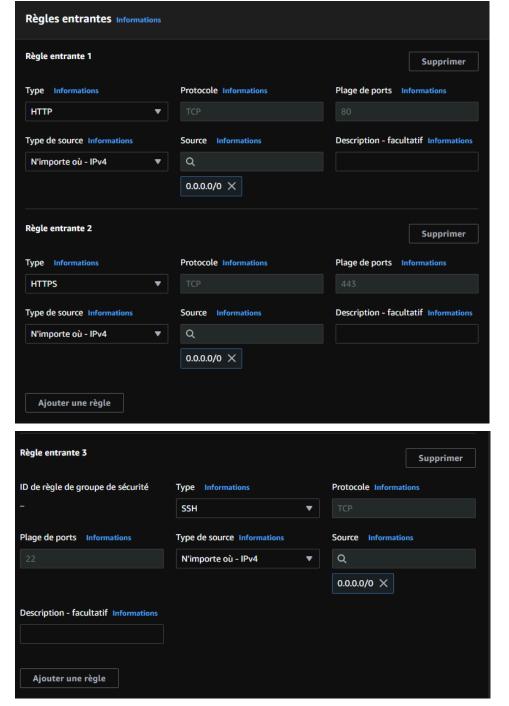

→ Next, create two subnets: one public subnet and one private subnet, specifying appropriate CIDR ranges.

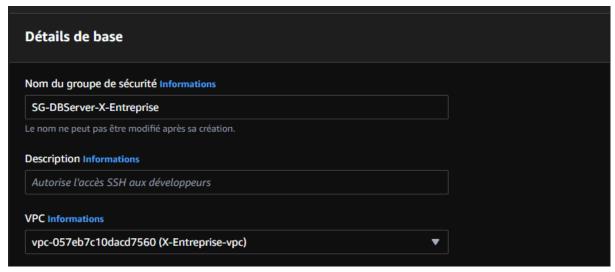

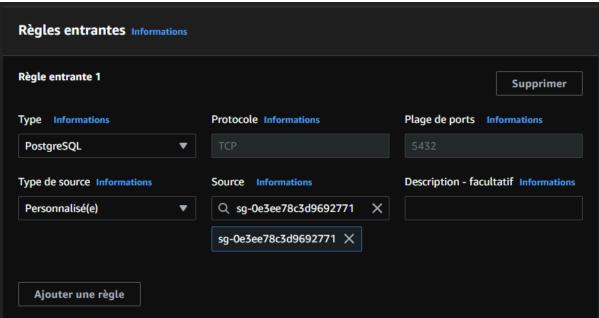

- → Create security groups to regulate inbound and outbound traffic for EC2 instances. There are two security groups created for this purpose:
- → SG-WebServer-X-Enterprise (for EC2 instances in the public subnet):
  - Inbound Rules:
     Allow HTTP (port 80) traffic from anywhere.
     Allow HTTPS (port 443) traffic from anywhere.
     Allow SSH (port 22) traffic from anywhere.
  - Outbound Rules :
     All outbound traffic is allowed by default.

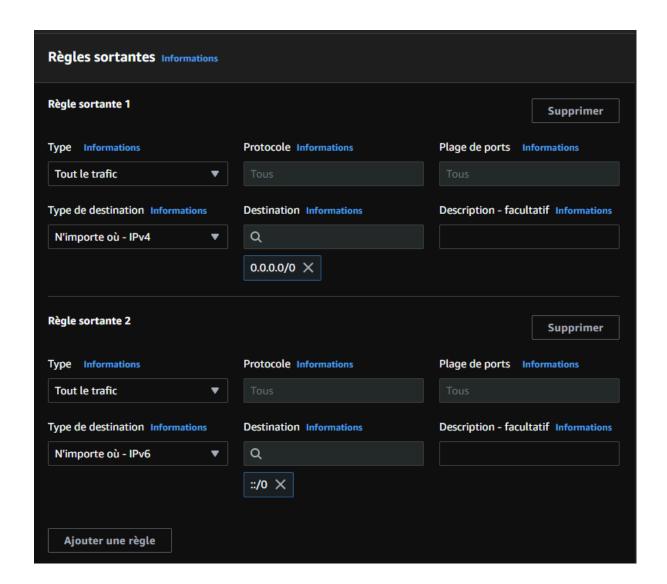

- → SG-DBServer-X-Enterprise (for RDS database instances in the private subnet) :
  - Inbound Rules:
     Allow PostgreSQL (port 5432) traffic from SG-WebServer-X-Enterprise.
  - Outbound Rules:
     All outbound traffic is allowed by default

#### Result:

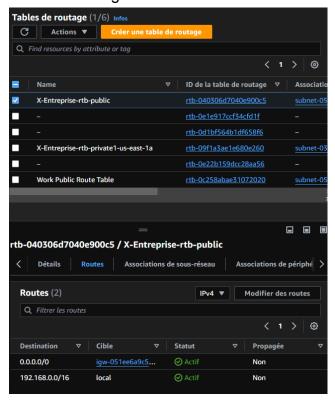

### 3.2 Adding Internet Gateway

- In the VPC console, select "Internet Gateways" and click on "Create Internet Gateway".
- Attach the Internet Gateway to the VPC created earlier.

Select the Internet Gateway you just created and click on "Actions" -> "Attach to VPC".

Select your VPC-X-Enterprise and click on "Attach Internet Gateway".

Modify the public route table to include a route to the Internet Gateway.
 Click on "Add route" and enter "0.0.0.0/0" as the destination (which means all traffic) and select the Internet Gateway you attached to your VPC as the target.

### 3.3 Creating EC2 Instances

→ Go to the EC2 console and click on "Launch Instance".

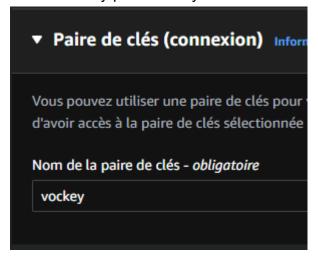

→ Select the Amazon Linux 2 (version 2023) image.

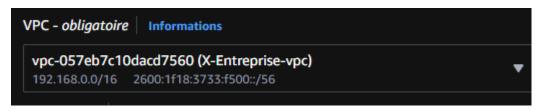

→ Choose the instance type "t2.micro".

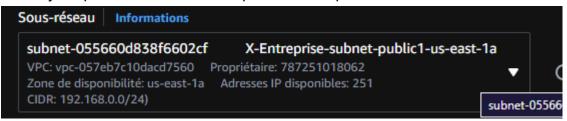

→ Select the key pair "vockey".

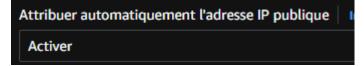

→ In the network settings, choose your VPC "x-enterprise-vpc".

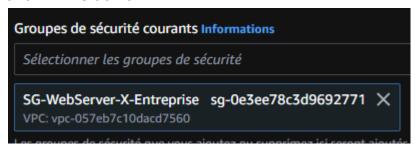

→ Select your public subnet: "x-enterprise-subnet-public-us-east-1a".

→ Check the box to enable "Auto-assign Public IP".

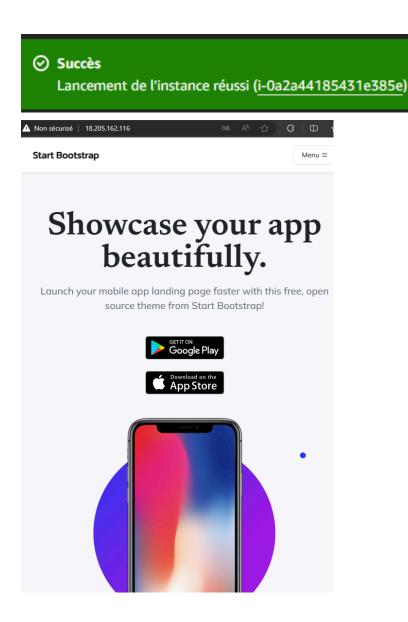

→ Select the existing security group "sg-webserver-x-enterprise" to allow HTTP and HTTPS traffic.

→ Copy this script to my EC2 instance, and then execute it to install and start Apache.

```
#!/bin/bash
# Installation d'Apache
echo "Installation d'Apache..."
sudo yum update -y
sudo yum install -y httpd
sudo systemctl start httpd
sudo systemctl enable httpd
# Clonage du dépôt Git
echo "Clonage du dépôt Git..."
git clone https://github.com/Nerlyss1/CAPSTONE-PROJECT.git
# Copie des fichiers vers /var/www/html
echo "Copie des fichiers vers /var/www/html..."
cd CAPSTONE-PROJECT/2024/b3/cloud/sample-app
sudo cp -r * /var/www/html/
# Attribution des permissions
echo "Attribution des permissions..."
sudo chown -R apache:apache /var/www/html
sudo chmod -R 755 /var/www/html
# Redémarrage d'Apache
echo "Redémarrage d'Apache..."
 sudo systemctl restart httpd
echo "Installation et déploiement terminés avec succès."
```

→ Finally, launch the instance.

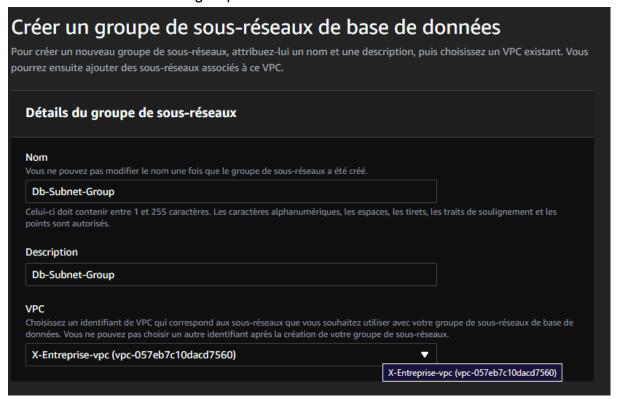

#### 4. Database Creation

### 4.1. Creating PostgreSQL Database on AWS RDS

→ Go to the RDS service.

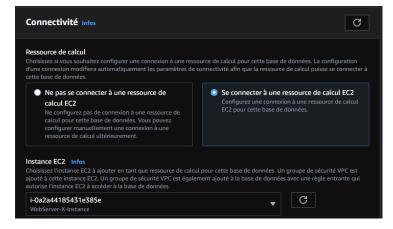

→ Create a database subnet group

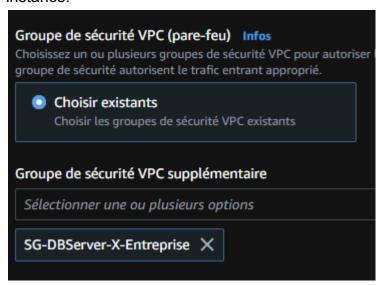

- → Click on "Create database".
- → Choose PostgreSQL as the database engine.

- → Configure database instance details such as instance type
- → Connection of instance EC2

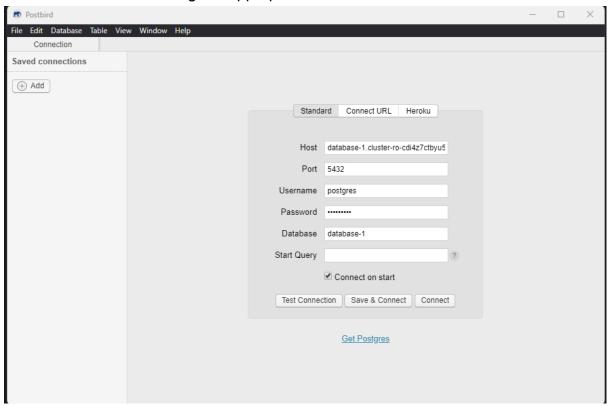

→ Select security group options to allow access to the database from your EC2 instance.

→ Launch the database creation process.

#### 4.2. Installation and Configuration of Postbird

- → Install Postbird
- → Once Postbird is installed, launch the application and connect to your RDS database using the appropriate credentials.

#### 5. Database Connection

- → An SSH connection is established with the EC2 web server.
- → A PostgreSQL client is installed on the web server.
- → A connection to the database is established from the command line to verify connectivity and functionality.
